

The Chimneys

Each chimney is just the most visible part of a 200 megawatt unit. A complete unit is made up of a chimney, boiler, steam turbine, generator, electrostatic precipitators, and many pumps and motors to drive the cooling system.

At Hazelwood each chimney is 137 metres high. It has a diameter of 11 metres at the base, 7.4 metres at the top and is made from self-supporting reinforced concrete lined with fire brick.
