

## Canunda wind farm

The Canunda wind farm at Lake Bonney, near Millicent in South Australia's south east, represents a diversification of the company's energy business in Australia.

Canunda is jointly owned by ENGIE (72 per cent) and Mitsui & Co Ltd (28 per cent).

Canunda wind farm has 23 turbines capable of generating approximately 46 MW of electricity - enough to provide the power needs of about 30,000 homes.

Each wind turbine blade spans 39 metres.

The turbines at Canunda can generate at wind speeds from 4m/sec (14.4km/h) and produce energy with wind speeds up to 25m/sec (90km/h).

The wind yield in South Australia enables Canunda to produce electricity up to 34 per cent of the time - a very high yield by global standards.

The wind farm occupies a site approximately 8km long by 3km at its widest point, and is linked by a 14km 33,000 volt transmission line to electricity transmission facilities at the Snuggery substation adjacent to the company's Snuggery power station.

Canunda wind farm operates as an unscheduled market generator.
